11. DETAILED PROPOSAL OF THE ACTIVITY

A. Title of the activity: **National Seminar on "Role of Microorganisms in Agriculture and Plant Science for Sustainable Development"**.

B. Background including details of past events organized on the proposed topic: **Role of Microorganisms in Agriculture and Plant Science for Sustainable Development"**.

C. Aims/Objectives (in at least 500 words): The seminar is aimed to promoting discussion, information, sharing Plant Science knowledge and to have new insights in recent development in the field of plant biotechnology for agricultural and Human welfare. As well as to bring together different scientists, academicians, research scholars on common platform to discuss the development and future trends in the field of Botany, plant biotechnology, Medical science and Agriculture development for Human welfare. A **microorganism** is a microscopic organism, which may be single-celled or multicellular. The study of microorganisms is called microbiology, a subject that began with the discovery of microorganisms in the 1670s by Antonie van Leeuwenhoek. Robert Hooke coined the term "cell" after viewing plant cells under his microscope. Later, in the 19th century, Louis Pasteur found that microorganisms caused food spoilage. In 1876 Robert Koch discovered that microorganisms cause diseases.

Microorganisms are very diverse and include all **bacteria, archaea** and most **protozoa**. This group also contains some **fungi, algae**, and some micro-animals such as rotifers. Many macroscopic animals and plants have microscopic juvenile stages. Some microbiologists classify **viruses** and viroids as microorganisms, but others consider these as nonliving. In July 2016, scientists identified a set of 355 genes from the last universal common ancestor of all life, including microorganisms, living on Earth.
